DETAILED ACTION

Claim Objections

1. **Claims 22, 26-30, 32 and 39** are objected to because of the following informalities:

a) **In claim 22:** terms “**the** condition” in line 3, “**the** correspondence” in line 11, “**the** connection states” in line 15, and “**the** shuffle exchange” in line 19 are improper since there are no antecedent bases for such terms in the claim.

Examiner suggests changing these terms to “a condition”, “a correspondence”, “connection states”, and “a shuffle exchange”, respectively.

b) **In claims 26-30 and 32:** term “**X2** interconnection network” is improper since the number 2 should be subscripted.

Examiner suggests changing this term to “**X₂** interconnection network”.

c) **In claim 39:** terms “**the** condition” in line 3, “**the** correspondence” in line 11, “**the** connection states” in line 16, and “**the** shuffle exchange” in line 20 are improper since there are no antecedent bases for such terms in the claim.

Examiner suggests changing these terms to “a condition”, “a correspondence”, “connection states”, and “a shuffle exchange”, respectively.

Appropriate correction is required.

Allowable Subject Matter

2. The following is an examiner’s statement of reasons for allowance:

a) **In Regarding to Claims 22-38:** The prior arts fail to teach a method for implementing a class of NxN decompressors each serving a connection request to route m incoming signals,

$m \leq N$, and for enabling the service of any connection request in a nonblocking way on a condition that the connection request is compliant to certain constraints, the method for each of the decompressors comprising a combination of steps of:

wherein the constraints on the connection request are that:

- (1) the m active input addresses are consecutive upon a rotation of the ordering of the N input addresses, and
- (2) the correspondence between the m active input addresses and the m active output addresses is order preserving after the rotation; and

the class excluding

- (i) those having a switch constructed from the banyan network of switching cells prepended with a shuffle exchange, and
- (ii) those having a switch constructed from the shuffle-exchange network of switching cells prepended with the shuffle exchange.

b) In Regarding to Claims 39-42: The prior arts fail to teach a class of $N \times N$ decompressors each serving a connection request to route m incoming signals, $m \leq N$, and for enabling the service of any connection request in a nonblocking way on a condition that the connection request is compliant to certain constraints, each of the decompressors comprising a combination of steps of:

wherein the constraints on the connection request are that:

- (1) the m active input addresses are consecutive upon a rotation of the ordering of the N input addresses, and

(2) the correspondence between the m active input addresses and the m active output addresses is order preserving after the rotation; and
the class excluding

(i) those having a switch constructed from the banyan network of switching cells prepended with a shuffle exchange, and

(ii) those having a switch constructed from the shuffle-exchange network of switching cells prepended with the shuffle exchange.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance".

Citation of Relevant Prior Art

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The Patent number of the prior art are listed below are considered as citation of relevant prior art in the field of the invention relating to broadband switching and control over a massive broadband switching network:

McKeown (US 5,500,858); Ofek (US 6,757,282); Batholomew et al. (US 6,400,708); Galand et al. (US 5,568,477); Ha-Duong (US 5,768,270); Muller et al.
